                                                                                                                                                                                                The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Albrimer's disease, hIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Cell cycle; human; CpG dinucleotide; cytosine methylation, HIV; aging; human immunodeficiency virus; neurodegenerative disorder; solid tumour; graft versus host disease; glomerular disease; Lewy body disease; cancer; arthritis; arteriosclerosis; anti-HIV; neuroprotective; antiarthritic; immunosuppressive; antitumour; cytostatic; antiarteriosclerotic; ds:

                                                                                                                                                                                Sequences AAS45296-AAS45520 represent chemically pretreated genomic DNA molecules associated with the cell cycle and specific PCR primers of the invention. The sequences are useful for detecting the methylation state of all CPG dinuclectides in a sequence and therefore for analysing associated diseases. By analysing cytosine methylations in the pretreated DNA, genetic and/or epigenetic parameters for the diagnosis and therapy of existing diseases or the predisposition to specific diseases can be secretained. The parameters may be compared to another set of genetic and/or epigenetic parameters, the differences serving as basis for diagnosis and/or prognosis events which are disadventageous to patients. The sequences of the invention are useful for the diagnosis and therapy of HIV infection, neurodegenerative disorders, graft-versus-host disease, arteriosclerosis, solid tumours and cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            972 AGTATGCACGTTGGAGTGATTGGCTGTTCTGGAAGAACAGGGAAAGTGATTGTCTCAGCT 1031

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Albriemer's diseases, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA transcription associated gene; peptide nucleic acid; PNA-oligomer; PNA, cytosine methylation state; SNP; retroviral infection; gene; ds; single nuclectide polymorphism; adenosine deaminase deficiency; cancer; viral infection; Sezsty syndrome; haematological disorder; tuberculosis; immunological disorder; Werner syndrome; developmental disorder; psoriasis; Rieger's syndrome; nourological disorder; erythropolesis; neurodegenerative disorder; wardenburg syndrome; Niemann-Pick disease; mayelodysplastic syndrome; wyocardial infarction; hypertension; arthritis; angiogenesis; congenital heart disease; HDR syndrome; gene therapy; polyglutamine disorder; solid tumour.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               δŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    δλ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a nucleic acid, which comprises a segment of the chemically pretradted DNA of genes associated with DNA transcription from one of 346 sequences, and an oligomer, in particular an oligomucleotide cor peptide nucleic acid (PNA)-oligomer that hybridises to or is identical cor peptide nucleic acid (PNA)-oligomer that hybridises to or is identical cor the chemically pretreated DNA of genes associated with DNA cranscription. The set of oligomer probes are useful for detecting the crytosine methylation state and/or single nucleotide polymorphisms (SNPs) in a chemically pretreated genomic DNA. The nucleic acids are useful for diagnosing or treating diseases associated with DNA transcription (particularly with the methylation status), e.g. adenosine deaminase deliciency, virsal infection, retroviral infection, serary syndrome, contrological disorders, immunological disorders, Merner syndrome, tuberculosis, developmental disorders, psoriasis, Reger's syndrome, contrological disorders, immunological disorders, manological disorders, morodagenerative disorders, marchemburg contrological disorders, and angoquensis, explorome, mycocardial concer. Sequences ABK28127-ABK28472 represent DNA transcription associated genomic DNA molecules of the invention.

Concern Sequence deata for this patent did not form part of the printed concerns better of the concern of the printed concerns better of the concern of the printed concerns better of the concerns of the printed concerns between the concerns of the concerns of the printed concerns between the concerns of t

The present invention relates to a Moraxella catarrhalis genomic library comprising of a combination of 41 nucleic acid molecules (see AAR78814-AAR78814). The library has a number of uses described in the specification e.g. is useful for aldentifying diagnostic and therapeutic compositions. M. catarrhalis (Branhamella catarrhalis) is a large acrobic, gram-negative diplococcus, normally found among the bacterial flocalised infections and as otitis media, sinusitis and bronchopulmonary infection and life-threatening, systemic diseases including endocarditis and meningitis.
                                                                        Genomic library; bacteria; human upper airway; otitis media; sinusitis; bronchopulmonary; endocarditis; meningitis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8570 GCCATATTGGCGATGGCAATTTACATTTAAATATTCTAAAACCTGCCAATTTGACCAAAG 8511

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Albriemer's diseases, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker;

The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for:

(a) assessing whether a patient is afflicted with prostate cancer;

(b) monitoring the progression of prostate cancer in a patient;

(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient;

(d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient;

(e) selecting a composition for inhibiting prostate cancer in a patient;

(f) assessing the prostate cell carcinogenic potential of a compound;

(g) determining whether prostate cancer has metastasized in a patient;

(g) determining whether prostate cancer has metastasized in a patient;

(h) assessing the aggressiveness or indolence of prostate cancer in a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a nucleic acid comprising a sequence (I) of at least 18 bases in length of a segment of chemically pre-treated genomic DNA whitch has any one of the sequences of (ABKA31919-ABKA4032) or its complement. Also included are an oligonuclectides which hybridises to (I), probes for detecting oytosine methylation or single-complements (SNP) in (I), an array of oligomers to (I), probes for detecting oytosine methylation states of the CpG dinuclectides of (I). The array is useful cor peptide nucleic and/or epigenetic parameters, classification, differentiation, grading, staping, treatment and/or diagnosis of attroxycomas, or the predisposition to astrocycomas by analysing openetic and/or epigenetic parameters, classification, differentiation, involves obtaining a biological sample containing genomic C methylations, involves obtaining a biological sample containing genomic C methylations, involves obtaining a biological sample containing genomic C methylations, involves obtaining a biological sample containing genomic C NNA, extracting the genomic DNA, converting cytosine bases which are unethylation to astrocycomas by analyting second or containing a biological sample containing genomic C NNA, extracting the genomic DNA, converting cytosine bases which are another base which is dissimilar to cytosine in terms of hybridisation cannot base which is dissimilar to cytosine in terms of hybridisation content or more data sets. The genomic DNA is the cytosine positions by reference to confer more data sets. The genomic DNA is of particular interest in astrocytom or bisulphite, hydrogen sulphite of or disulphite. The amplificates are detachable most of one or more cytosine positions or bisulphite, hydrogen sulphite or disulphite. The amplificates are detachable most of one or more cytosine positions or tissues, as opposed to background DNA. The amplificates are detachable most of one or more cytosine position or conference to an elected by matrix assisted laser desorption/indicy having a lectrometer. Con

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopethy, neovascular glaucoma and macular degeneration, arteriosclerosis, anemia, cancer, acute myeloid leukaemia, Albahimer's disease, AlbS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.

```
The invention relates to an isolated polynucleotide which is a polymorphic variant of glutamate receptor, metabotrophic 3 (GRM3) is a receptor for glutamate, the major excitory neurotransmitter in the mammalian central nervous system. Human GRM3 located on chromosome 7421.1-q21.2 is expressed in human focatal and adult whole brain especially in the caudate nucleus and corpus collosum. GRM3 hole brain especially in the caudate nucleus and corpus collosum. GRM3 function of GRM3. GRM3 polypeptide is used for screening and expression and recombinant non-human organism is used to study expression of GRM3 or vivo screening and testing of drugs targetted against GRM3 protein, and for testing the efficacy of therapeutic agents and compounds for neurological disorders in a biological system. GRM3 enablotypes are for treating diseases associated with GRM3 activity, e.g., neurological disorders. The present sequence is human GRM3 gene fragment containing polymorphic sites.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /*tag= a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δλ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated polynucleotide which is a polymorphic variant of glutamate receptor, metabotrophic 3 (GRM3) is areaptor for glutamate, the major excitory sequence GRM3 is a receptor for glutamate, the major excitory neurotransmitter in the mammallan central nervous system. Human GRM3 located on chromosome 7421.1.421.2 is expressed in human foretal and adult whole brain especially in the caudate nucleus and corpus collosum. GRM3 of MA is useful in gene therapy and also for studying the expression and for inciton of GRM3. GRM3 polypeptide is used for screening drugs. A recombinant non-human organism is used to study expression of GRM3 GC in vivo, for in vivo screening and testing of drugs targetted against compounds for neurological disorders in a biological system. GRM3 compounds for treating diseases associated with GRM3 and protypes are for treating diseases associated with GRM3 activity, neurological disorders. The present sequence is an alleitc variant containing polymorphic sites (PS):

The invention relates to a nucleic acid (I) comprising a segment of 18 bases of chemically pretreated DNA of anglogenesis-associated genes (II) having sequences (ABG6691-ABG67118) or their complements. (I) also related oligomers, are used to evaluate the methylation status and/or single-nucleotide polymorphisms, in anglogenesis-related genes, for diagnosis and treatment of eye diseases, proliferative retinopathy, necvascular glaucoma, solid tumours, inflammation, rheumatoid arthritis, ediabetic retinopathy, macular degeneration caused by neovascularisation, psoriasis, arteriosclerosis, inflammatory bowel diseases, ulcers and Crohn's disease. Complement of this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; anglogenesis; methylation; eye disease; glaucoma; tumour; inflammation; rheumatold arthritis; diabetic retinopathy; antiulcerds; macular degeneration; inflammatory bowel disease; Crohn's disease; antirheumatic; antiarthritic; antidiabetic; antipsoriatic; antiarteriosclerotic; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Óγ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a nucleic acid comprising a sequence of 18 bases, of a segment of chamically pretreated DNA (CP DNA) e.g. with bisulphite, of genes associated with tumour suppression and oncogenes having a sequence taken from 536 (actually 533 since numbers 408, 458 and 500 are missing from the sequence listing) sequences complementary to (Ss). The nucleic acid may be peptide nucleic acid coligomer (PNA) of at least 9 nucleotides and may form part of a set of probes for detecting the oytosine methylation state and cumours. The probes can also be used in a method for ancers and tumours. The probes can also be used in a method for ascertaining genetic and/or epigenetic parameters for the diagnosis and/or therapy of existing diseases associated with CpG dinucleotides e.g. canneers and tumours. The probes can also be used in a method for ascertaining genetic and/or epigenetic parameters for the diagnosis and/or therapy of existing diseases or the predisposition to specific compared to another set of genetic and/or epigenetic parameters may be differences serving as basis for diagnosis and/or prognosis events which are disadvantageous to patients. The present sequence is one of the 533 genomic sequences derived from tumour suppressor genes and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                 Fragments of chemically modified genes associated with tumour suppressor genes and oncogenes, useful in designing primers and probes for analysing diseases associated with cytosine methylation state e.g.

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Albriemer's disease, AlbS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     4049 TAAACCTCCCCACACTATTACACGAATAAATTTTATCTTAATCCTACCAAAATAAAAAT 3990

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Albrahimer's disease, AlbS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/alcerative bowel diseases. The present sequence is a gene of the invention.

The present invention relates to chemically modified DNA sequences of signal transduction associated genes. The DNA sequences are chemically modified using a solution of bisulphite, hydrogen sulphite or modified using a solution of bisulphite, hydrogen sulphite or disulphite. Also disclosed are oligonoclectides and/or PNA oligomers of conferencing the cytosine methylation state (ppd islands) of these genes, and a method for the diagnosis and/or therapy of genetic and epigenetic parameters of genes associated with signal transduction. The genomic DNA can be obtained from cells or cellular components which contain DNA, e.g. cell lines, biopsies, blood, sputum, stool, urine, cerebral spinal fluid, tissue embedded in paraffin such as tissue from eyes, intestine, kidney, brain, heart, prostate, lung, breast or liver, histologic object slides, and all their possible compinations. Invervious expenses of the invention are useful for the diagnosis and therapy of diseases associated with signal transduction e.g. solid tumours and sequences of different genes associated with signal transduction, or their complementary sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; signal transduction associated gene; cytosine methylation state; CpG island; signal transduction associated disease; solid tumour; cancer; antitumour; cytostatic; mutant; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oligonucleotide for diagnosis and therapy of diseases associated with signal transduction e.g. cancer, comprises chemically modified genomic sequences of genes associated with signal transduction

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Albriemer's disease, AlbS, eplilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosts and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukemania, Albrimer's disease, AlbS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                     ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/dicerative bowel diseases. The present sequence is a gene of the invention.

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arterlosclerosis, anomana, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel
                                                                 ö

From Staphylococcus epidermidis. (I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the scale polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their creatment of S. epidermidis lifections, e.g. endocarditis. AAH5397 to AAH55090 represent specifically claimed S. epidermidis genomic DNA AH5509 represent oligonucleotide sequences and primers which are used to the present invention of the present invention. AH55091 to sequence given in the sequence listing of the present specifically claims all the polypucleotide sequence listing of the present specification, one weaptification of the present invention specifically claims all the polypucleotide sequence listing off the present specification, one sequences are given in the disclosure for SEC in No. 4472, no sequences are given in the disclosure for SEC in No. 4465 to 4472, no sequences are given in the disclosure for SEC in No. 4465 to 4472,
                                                                                                                                             ;

(I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH55090 represent specifically claimed S. epidermidis genomic DNA polymucleotide sequences from the present invention. AAH55091 to AAH5509B represent oligonucleotide sequences and primers which are used in the exemplification of the present invention.

N.B. The present invention specifically claims all the polymucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4455 to 4472, no sequences are present for SEQ ID NO:4455 to 4472,
                                                                                                                                                                                                                                                                                                                          2911 ATAAAAATTGCATATAGATCCTCCGTTCCTATTCTGTATAACAATAATTATAAGTTAT 2970
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2971 GAACACCCCAATATTAAACAAAACCACTTTTTACTCTAACTCTAAATAAAAACCACTTTT 3030

                                                                                                    The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Albrahier's disease, AlbS, epllepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.

                              The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AlbS, epilepsy, neurofibromatosis, rheumatoid arthritis, psorlasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer, stage of prostate cancer -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated dnaE, dnaX and dnaB genes from Gram positive bacteria, used to develop screening assays for identifying antibiotic compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         330 CAATAGCGATCAGATTGCTTTGTAGGGTTTGTATGCGTTGTTTTTTACTAGGAAGAGCTT 389
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
The invention relates to an isolated nucleic acid molecule (I) comp a nucleotide sequence given in Tables 1-9 (ABNO010-ABN05213) of this specification or its complement. (I) is useful for:
(a) assessing whether a patient is afflicted with prostate cancer; (b) monitoring the prostato of procestate cancer in a patient; (c) assessing the efficacy of a test compound to inhibit prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         patient;
(I) is also useful as a pharmacodyanamic or pharmacogenomic marker.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0;

This sequence is the partial dnaN gene of Staphylococcus aureus. The invention relates to a number of isolated DNA molecules from Gram positive bacterium, corresponding to dnaR molecules from Gram positive bacterium, corresponding to dnaR dnaN molecules from Gram (AAZ31002).and dnaB Gram and and East corresponds to the about of the Escherichia coli, DNA polymerase III holoenzyme, alpha subunit of the Escherichia coli, DNA polymerase III holoenzyme, dnax corresponds to the gamma and tau subunits, and dnaB corresponds to the particular to the gamma and tau subunit is the actual DNA polymerase, the gamma complex forms the clamp loader and tau is a "glue protein". Dnax encodes both gamma and Tau III is the product of the gram is the product of the gene. DnaN forms the belta subunit which forms the silding clamp, and dnaG encodes a primase. The DNA sequences of the invention can be used to identify agents that invention can be used to identifying pharmacological agents or lead compounds for agents active at the level of a replication protein can be used compounds for agents active at the level of a replication protein as antibiotics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The specification describes DNA molecules from Gram positive bacteria, which comprise a coding region from a polC, dnaE, hola, holB, dnaX, dnaN, ssb, dnaG or a dnaB gene. These sequences encode proteins that replicate the chromosome of Gram positive bacteria. They are used for sequencing and amplification of DNA and in drug discovery to identify compounds which have antibiotic activity through interference with replication. They are used in methods for identifying compounds that are active at the level of DNA replication and result in arrest of cell growth or cell death of bacteria to treat bacterial infections in animals.
                                                                                                                                                              Isolated DNA molecule from a Gram positive bacterium encoding DNA replication proteins used to identify compounds which have antibiotic activity -

ANH3252-AAH32627 represent CDNAs corresponding to 35 human secreted protein genes, and AAG73346-AAG73448 represent the proteins they encode.

Encoded and AAG73346-AAG73448 represent the proteins they encode and their corresponding secreted proteins are useful for preventing, and their corresponding secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the mouth of the new protein in a sample or by determining the presence of amount of the new protein in a sample or by determining the presence of the protein in the new genes. Specific uses are described for each of the CS genes, based on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of the interpretative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, deseases of the immune system, and includent disorders (e.g., profilated are proteins and action of the interpretation of architists), inflammation, allergies, neurological disorders (e.g., Alzheimer's disease, atherosales, and action of an action of an infections. The proteins can also be used to aid wound the hand infections. The proteins can also be used to aid wound contain and epithelial cell proliferation, to prevent skin aging due to culture of primary tissues, to regenerate tissues, to cidentify their cognate ligands or binding partners, and in chemotaxis, and can be used in disorders specific for a protein of the invention can be used in disorders specific for a protein of the disorders mentioned above, and indianoschem tassay (ELISA). The present sequence represents a human con a manning and protein of the invention or expersents a human con a manning and protein of the invention or expersents a human contains and contains an action of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  694 TTCTAAGTAATCAAGAAAAATCTTGGACAATAGCTTTTCCATAGAGAAAACCGTGAGGA 753

AMH33522-AAH32627 represent cDNAs corresponding to 35 human secreted protein grade and AAG73346-AAG7348 represent the proteins they encode. AAG73449-AAG73519 represent human secreted protein fragments. The genes and their corresponding secreted protein are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be disgnosed by determining the mount of the new protein in a sample or by determining the presence of mutations in the new protein in a sample or by determining the presence of mutations in the new protein in a sample or by determining the presence of mutations in the new protein in a sample or by determining the presence of mutations in the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the soft of the protein of a disgnosis or treatment of the protein of a disgnosis or treatment of a hormalities, hemantopoietic disorders, foetal and developmental abortein disorders (e.g., Alzhelmer's disease) candiovascular disorders (e.g., rheumatoid arthritis), inflammation, alternative disorders (e.g., poorlasis), sepsis, diabetes, atherosclerosis, skin disorders, and infections. The proteins can also be used to aid wound clooning and epithelial call proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell collure of primary tissues, to regenerate tissues, to identify their conducte ligands or binding partners, and in chemotaxis, and can do an be used on a trobedies specific for a protein of the invention can be used in

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (1) amino acid sequences given in AAM81701 to AAM91921. (1) have cytostatic activity, and can be used in gene therapy and vaccine production. (1) proteins and polynuclectics may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (1) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (1) by expressing inactive proteins or to supplement the patients own production of (1). Additionally, (1) polynuclectides may be used to produce the secreted (1). by inserting protein calls into a host cell and culturing the cell to express the protein. (1) proteins and polynuclectides may be used to produce the secreted (1). by inserting cancers and cancer metastases of haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic derived cells. AAK64703 to AAK876494 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK87642 to AAK876950 and AAM82169 crepresent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (1) amino acid sequences given in AAM81210 to AAM91921. (1) have cytostatic acitivity, and can be used in gene therapy and vaccine production. (1) proteins and con be used in gene therapy and vaccine production. (1) proteins and polymuclectides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (1) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (1) by expressing inactive proteins or to supplement the patients own production of (1). Additionally, (1) polymiclectides may be used to produce the secreted (1), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (1) proteins and polymuclectic-derived cells. AAK64010 cancers and cancer metastases of haematopoietic-derived cells. AAK6401 to AAK8764 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK87642 to AAK67650 and AAM82169 crepresent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  694 TICTAAGTAATCAAGAAAAATCTTGGACAATAGCTTTTCCATAGAGAAAACCGTGAGGA 753

the invention relates to a nucleic acid (I) comprising a segment of 18 bases of chemically pretreated DNA of andiogenesis associated genes (II) having sequences (ABQ66971-ABQ67178) or their complements. (I), also related oligomers, are used to evaluate the methylation status and/or single-nucleotide polymorphisms, in anglogenesis-related genes, for diagnosis and treatment of eye diseases proliferative rethiopathy, necular dependence, inflammation, rheumatoid arthritis, diabetic rethiopathy, macular degeneration caused by necvascularisation, crohn's disease, unflammatory bowel diseases, ulcers and crohn's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                   Human; anglogenesis; methylation; eye disease; glaucoma; tumour; inflammation; rheumatoid arthritis; diabetic retinopathy; antiulcerds; mancalar degeneration; inflammatory bowel disease; Crohn's disease; antirheumatic; antiarthritic; antidabetic; antipsoriatic; antiarteriosclerotic; ds.

The present sequence is the genome sequence of Listeria monocytogenes EGD-e. This sequence and fragments of this sequence are useful for selecting probes and primers for detecting genes in L. monocytogenes and related organisms, and to study genetic polymorphisms and other genomes. Proteins (ABB47297-ABB50149) expressed from the present sequence are monocytogenes and related organisms, and for biosynthesis and biodegradation, especific antibodies, identification of L. biotegradation, especially biosynthesis of Vitamin B12. This sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication and modulate L. monocytogenes-related diseases. In addition, this sequence and proteins encoded by it are useful in pharmacentical and vaccines compositions for the treatment or prevention of infections by L. monocytogenes and related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             organisms or detailed this patent did not form part of the printed Note: The sequence data for this patent did not sepecification, but was obtained in electronic format directly from WIPO

Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to the oplynucleotide which comprises a 1'-end sequence complementary to a polynucleotide comprises a 1'-end sequence; where the oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence; selected from those defined in the specification. The primer sets can be used in antisense therapy and

ö
in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-iength cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length AAH13631 to AAH1842 represent human cDNA sequences; AAB92446 to AAH13633 represent human amino acid sequences; and AAH13629 to AAH13632 represent of the present of sequences; and AAH13629 to AAH13632 for the present consequences; and AAH13639 to AAH13632 for the present consequences.
                                                                                                                                                                                                                                          816 AGCAACCTTCCCTTTGATTCTTTGATAATGACAAAGATGAACAAAGAGTAAGTTTTTGA 875

Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotides sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprise a 5'-end sequence and an oligonucleotide comprise a 3'-end sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the polynucleotide comprises a 3'-end sequence complementary to a polynucleotide at 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; primer; detection; diagnosis; antisense therapy; gene therapy; ss.

the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length coMas. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length coMas. The primers allow obtaining of the full-length coMas easily without any specialised methods. AAH03166 to AAH13628 and AAH3842 represent human coMas sequences, AAB2446 to AAH3622 represent human anno acid sequences; and AAH3629 to AAH3632 represent oligonucleotides, all of which are used in the exemplification

It currently consists of 5 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary caps between the contigs are represented as runitary caps between the contigs are represented as runitary caps between the contigs are represented as this of a sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Center project name: L4056
Center clone name: 21_M15
Center clone name: 21_M15
Sequencing vector: M13: M7815; 2% of reads
Sequencing vector: Plasmid: n/a; 38% of reads
Sequencing vector: Plasmid: n/a; 38% of reads
Chemistry: Dye-terminator H1g Dye: 100% of reads
Assembly program: Phrap; version 0,960731
Consensus quality: 146254 bases at least 040
Consensus quality: 148194 bases at least 030
Consensus quality: 148194 bases at least 020

```
unambiguously on both strands, or on a single strand with both a dye primer and dye terminator reaction, from distinct subclones. Exceptions are indicated by an explicit note.

Exceptions are indicated by an explicit note.

IMPORTANT: This sequence is not the entire insert of clone KOBFB. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

The true left end of clone KOBFB is at 26081 in sequence 26449.

The true right end of clone KOBFB is at 101 in sequence 26449.

The start of this sequence (1. .100) overlaps with the end of sequence 26449.

The end of this sequence (1. .100) overlaps with the start of sequence 268314.

For a graphical representation of this sequence and its analysis see:— http://wormbase.sanger.ac.uk/perl/ace/elegans/seq/sequence?

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 IMPORTANT: This sequence is NOT necessarily the entire insert of the specified clone. It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

E-mail: jes@sanger.ac.uk or rwienematode wusti.edu on Dec 12, 1996 this sequence version replaced gi:1041346. Coding sequences below are predicted from computer analysis, using predictions from Genefinder (P. Green, U. Washington), and other wallable information.

Current sequence finishing criteria for the C. elegans genome sequencing consortium are that all bases are either sequenced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1132 AAAAGTCCGGCTCCGTAAGCTTTTTTCTCCCCATCTTGTTGACAGATTCCAATT 1073
